Benchmark Example No. 4

Design of a Rectangular CS for Bending and Axial Force

1 Problem Description

The problem consists of a rectangular section, as shown in Fig. 1. The cross-section is designed for an ultimate moment $M_{Ed}$ and a compressive force $N_{Ed}$ and the required reinforcement is determined.

\[ A_{s,E0E} / 2 \]
\[ b \]
\[ h \]
\[ d \]
\[ d_1 = d_2 \]

Figure 1: Problem Description

2 Reference Solution

This example is concerned with the design of sections for ULS, subject to bending with axial force. The content of this problem is covered by the following parts of DIN EN 1992-1-1:2004 [1]:

- Design stress-strain curves for concrete and reinforcement (Section 3.1.7, 3.2.7)
- Basic assumptions for section design (Section 6.1)
- Reinforcement (Section 9.3.1.1, 9.2.1.1)

In doubly reinforced rectangular beams, the conditions in the cross-section at the ultimate limit state, are assumed to be as shown in Fig. 2. The design stress-strain diagram for reinforcing steel considered in this example, consists of an horizontal top branch, as presented in Fig. 3 and as defined in DIN EN 1992-1-1:2004 [1] (Section 3.2.7).

3 Model and Results

The rectangular cross-section, with properties as defined in Table 1, is to be designed, with respect to DIN EN 1992-1-1:2004 (German National Annex) [1], [2], to carry an ultimate moment of 382 kNm with an axial compressive force of 1785 kN. The calculation steps with a commonly used design method [3] [4] are presented below and the results are given in Table 2. Here, it has to be mentioned that the standard methods employed in order to calculate the reinforcement are approximate, and therefore deviations often occur.

4  Design Process

Design with respect to DIN EN 1992-1-1:2004 (NA) [1] [2]:

Material:
Concrete: $\gamma_C = 1.50$
Steel: $\gamma_S = 1.15$

$f_{ck} = 30 \text{ MPa}$
$f_{cd} = a_{cc} \cdot f_{ck} / \gamma_C = 0.85 \cdot 30 / 1.5 = 17 \text{ MPa}$

$f_{yk} = 500 \text{ MPa}$
$f_{yd} = f_{yk} / \gamma_S = 500 / 1.15 = 434.78 \text{ MPa}$

Design Load:
$N_{Ed} = -1785 \text{ kN}$
$M_{Ed} = 382 \text{ kNm}$

$\frac{e_d}{h} = \left| \frac{M_{Ed}}{N_{Ed} \cdot h} \right| = \left| \frac{382}{-1785 \cdot 0.50} \right| = 0.428 < 3.5$

$\Rightarrow$ Axial force dominant $\Rightarrow$ Design with respect to $\mu - \nu$ interaction diagram is suggested

Design with respect to Interaction diagram for Bending with axial force for rectangular cross-sections:

$\mu_{Ed} = \frac{M_{Ed}}{b \cdot h^2 \cdot f_{cd}} = \frac{382 \cdot 10^{-3}}{0.30 \cdot 0.50^2 \cdot 17.0} = 0.30$

$\nu_{Ed} = \frac{N_{Ed}}{b \cdot h^2 \cdot f_{cd}} = \frac{-1785 \cdot 10^{-3}}{0.30 \cdot 0.50 \cdot 17.0} = -0.70$

from design chart for $d_1/h = 0.05/0.5 = 0.10$:

$\omega_{tot} = 0.60$

$A_{s,\text{tot}} = \omega_{tot} \cdot \frac{b \cdot h}{f_{yd} / f_{cd}} = 35.19 \text{ cm}^2$

$A_{s1} = A_{s2} = \frac{A_{s,\text{tot}}}{2} = 17.6 \text{ cm}^2$

---

1The tools used in the design process are based on steel stress-strain diagrams, as defined in [1] 3.2.7:(2), Fig. 3.8, which can be seen in Fig. 3.

2The sections mentioned in the margins refer to DIN EN 1992-1-1:2004 (German National Annex) [1], [2], unless otherwise specified.
5  Conclusion

This example shows the calculation of the required reinforcement for a rectangular beam cross-section under bending with axial force. It has been shown that the results are reproduced with excellent accuracy.
