1 Problem Description

The problem consists of a rectangular section, asymmetrically reinforced, as shown in Fig. 1. Different loading conditions are examined, always consisting of a bending moment M_{Ed} , and in addition with or without a compressive or tensile axial force N_{Ed} . The crack width is determined.

Figure 1: Problem Description

2 Reference Solution

This example is concerned with the control of crack widths. The content of this problem is covered by the following parts of DIN EN 1992-1-1:2004 [1]:

- Design stress-strain curves for concrete and reinforcement (Section 3.1.7, 3.2.7)
- Basic assumptions for calculation of crack widths (Section 7.3.2, 7.3.3, 7.3.4)

Figure 2: Stress and Strain Distributions in the Design of Cross-sections

The design stress-strain diagram for reinforcing steel considered in this example, consists of an inclined top branch, as defined in DIN EN 1992-1-1:2004 [1] (Section 3.2.7).

3 Model and Results

The rectangular cross-section, with properties as defined in Table 1, is to be designed for crack width, with respect to DIN EN 1992-1-1:2004 (German National Annex) [1] [2]. The calculation steps with different loading conditions and calculated with different sections of DIN EN 1992-1-1:2004 are presented below and the results are given in Table 2.

Material:

Concrete: $\gamma_c = 1.50$

Steel: $\gamma_s = 1.15$

$f_{ck} = 25 \text{ MPa}$

$f_{cd} = \alpha_{cc} \cdot f_{ck} / \gamma_c = 0.85 \cdot 25 / 1.5 = 14.17 \text{ MPa}$

$f_{yk} = 500 \text{ MPa}$

$f_{yd} = f_{yk} / \gamma_s = 500 / 1.15 = 434.78 \text{ MPa}$

• Case II: $N_{Ed} = 300 \text{ kN}$

$$A_{s,min} \cdot \sigma_s = k_c \cdot k \cdot f_{ct,eff} \cdot A_{ct}$$

$$f_{ct,eff} = f_{ctm} \geq 3.0 \text{ MPa}$$

$$f_{ct,eff} = 2.6 < 3.0 \text{ MPa} \rightarrow f_{ct,eff} = 3.0 \text{ MPa}$$

$$A_{ct} = b \cdot h_{eff} = 0.15 \text{ m}^2$$

$$k_c = 0.4 \cdot \left[1 + \frac{1.0}{(2/3) \cdot 1 \cdot 3.0} \right] = 0.6 \leq 1$$

$$A_{s,requ} = 0.6 \cdot 0.8 \cdot 3.0 \cdot 0.15 \cdot 10^4 / 207.846 = 10.39 \text{ cm}^2$$

• Case III: $N_{Ed} = -300 \text{ kN}$

$$f_{ct,eff} = 2.6 < 3.0 \text{ MPa} \rightarrow f_{ct,eff} = 3.0 \text{ MPa}$$

$$A_{ct} = b \cdot h_{eff}$$

$$\sigma_u = f_{ct,eff} = 3.0 \text{ MPa}$$

$$\phi_s^* = 25 \cdot 2.9 / 3.0 = 24.16667$$

$$\sigma_s = \sqrt{w_k \cdot 3.48 \cdot 10^6 / \phi_s^*} = 207.846 \text{ MPa}$$

$$k_c = 0.4 \cdot \left[1 - \frac{\sigma_c}{k_1 \cdot (h/h^*) \cdot f_{ct,eff}} \right] \leq 1$$

$$k_1 = 1.5$$

$$k_c = 0.4 \cdot \left[1 - \frac{1.0}{1.5 \cdot 1 \cdot 3.0} \right] = 0.3111 \leq 1$$

$$A_{s,requ} = 0.3111 \cdot 0.8 \cdot 3.0 \cdot 0.1125 \cdot 10^4 / 207.846 = 4.04 \text{ cm}^2$$

In case the usage factor becomes 1.0 then the stresses σ_s are equal, as it can be seen in Case V below.

- Case V: $N_{Ed} = 0.0$, $A_s = 12.0 \text{ cm}^2$

In this case, the prescribed reinforcement is decreased from $A_s = 24.5 \text{ cm}^2$ to $A_s = 12.0 \text{ cm}^2$ in order to examine a case where the crack width control is not passed with the given reinforcement.

→ crack width control passed with additional reinforcement.

If we now input as prescribed reinforcement the reinforcement that is calculated in order to pass crack control, i.e. $A_s = 14.54 \text{ cm}^2$ we get a steel stress of $\sigma_s = 436.36 \text{ MPa}$ which gives

$$\phi_s = 25 \text{ mm} = \phi_s^* \cdot \frac{436.36 \cdot 14.54}{4(100 - 96) \cdot 30 \cdot 2.9}$$
